

Coveme New Year Message for Solarzoom 2015

The past year has shown a recovery in the PV market both in China and in the rest of the world in terms of volume , while prices continued to show a downward trend that had begun in 2013 with a rising focus on product quality.

Coveme continues the promotion and development of its dyMat® backsheet materials on a polyester base , increasing its durability up to 2.5 times higher than international requirements. These improvements continue with the introduction of new materials that provide superior performance both with respect to hydrolysis resistance and the resistance to UV ensuring also an increased benefit in the manufacturing process .

An always stronger sensitivity of the market emerges towards the use of completely recyclable backsheets, given that a day the hundreds of millions of panels in operation today will have to be discarded and replaced. Coveme has recognized this issue almost a decade ago and sells materials that are fully recyclable with processes already known and used in the industry.

The strong trend arising in the market which is the production of high-efficiency panels sees Coveme at the forefront having already developed a system of back-contact backsheet for both MWT and IBC cells . In 2015 the production on an industrial scale of this backcontact backsheet for MWT cell-based panels with the EBFoil® system will start , a system that provides customers also with the technology of assembling the panels completely automatically . The investments made are considerable , but the forecasts for the future are a growing development of photovoltaics for roof-top applications , commercial and residential , of high efficiency modules , for which these technologies are ideal .

Surely Coveme will continue its high degree of commitment in the photovoltaic industry. In fact, in April 2015 Coveme will double the production capacity in its Chinese plant in Zhangjiagang and will provide a demonstration for the backcontact backsheet technology.

Mr. Pier Luigi Miciano
